

NHS Satisfaction Analysis

British Social Attitudes Survey 2021

Project overview

Analysis of satisfaction with the National Health Service using the British Social Attitudes Survey 2021. The project uses R and a sample of 3,307 respondents.

Analytical methods

- Descriptive statistics
- Independent-samples t-test
- Chi-square test
- Linear regression
- Model diagnostics

Analytical workflow

1. Convert labelled survey variables and recode non-substantive responses.
2. Construct NHS satisfaction, age and socio-demographic variables.
3. Build a complete-case analytical dataset.
4. Compare NHS satisfaction across sex using an independent-samples t-test.
5. Examine education and NHS satisfaction categories with a Chi-square test.
6. Model NHS satisfaction as a function of age using linear regression.
7. Check residual normality, variance assumptions and model diagnostics.

Reproducibility

The original BSA 2021 survey dataset is not redistributed in this repository.
The analysis script documents the workflow and can be run when the local survey dataset is available.
